

Primary approaches to the building are on Route 6 from the east and from the west. In this view, approaching from the west, the rooftop mechanical units are screened by the volume of the sloped roof on the northwest corner of the building, especially since grade slopes substantially down to the west.

For pedestrians approaching from the south, the equipment is screened from view by the roof parapet, up to 250 feet away from the building.

View Study

Primary approaches to the building are on Route 6 from the east and from the west. In this view, approaching from the east, the rooftop mechanical units are screened by the volume of the raised metal roof over the main entrance.
